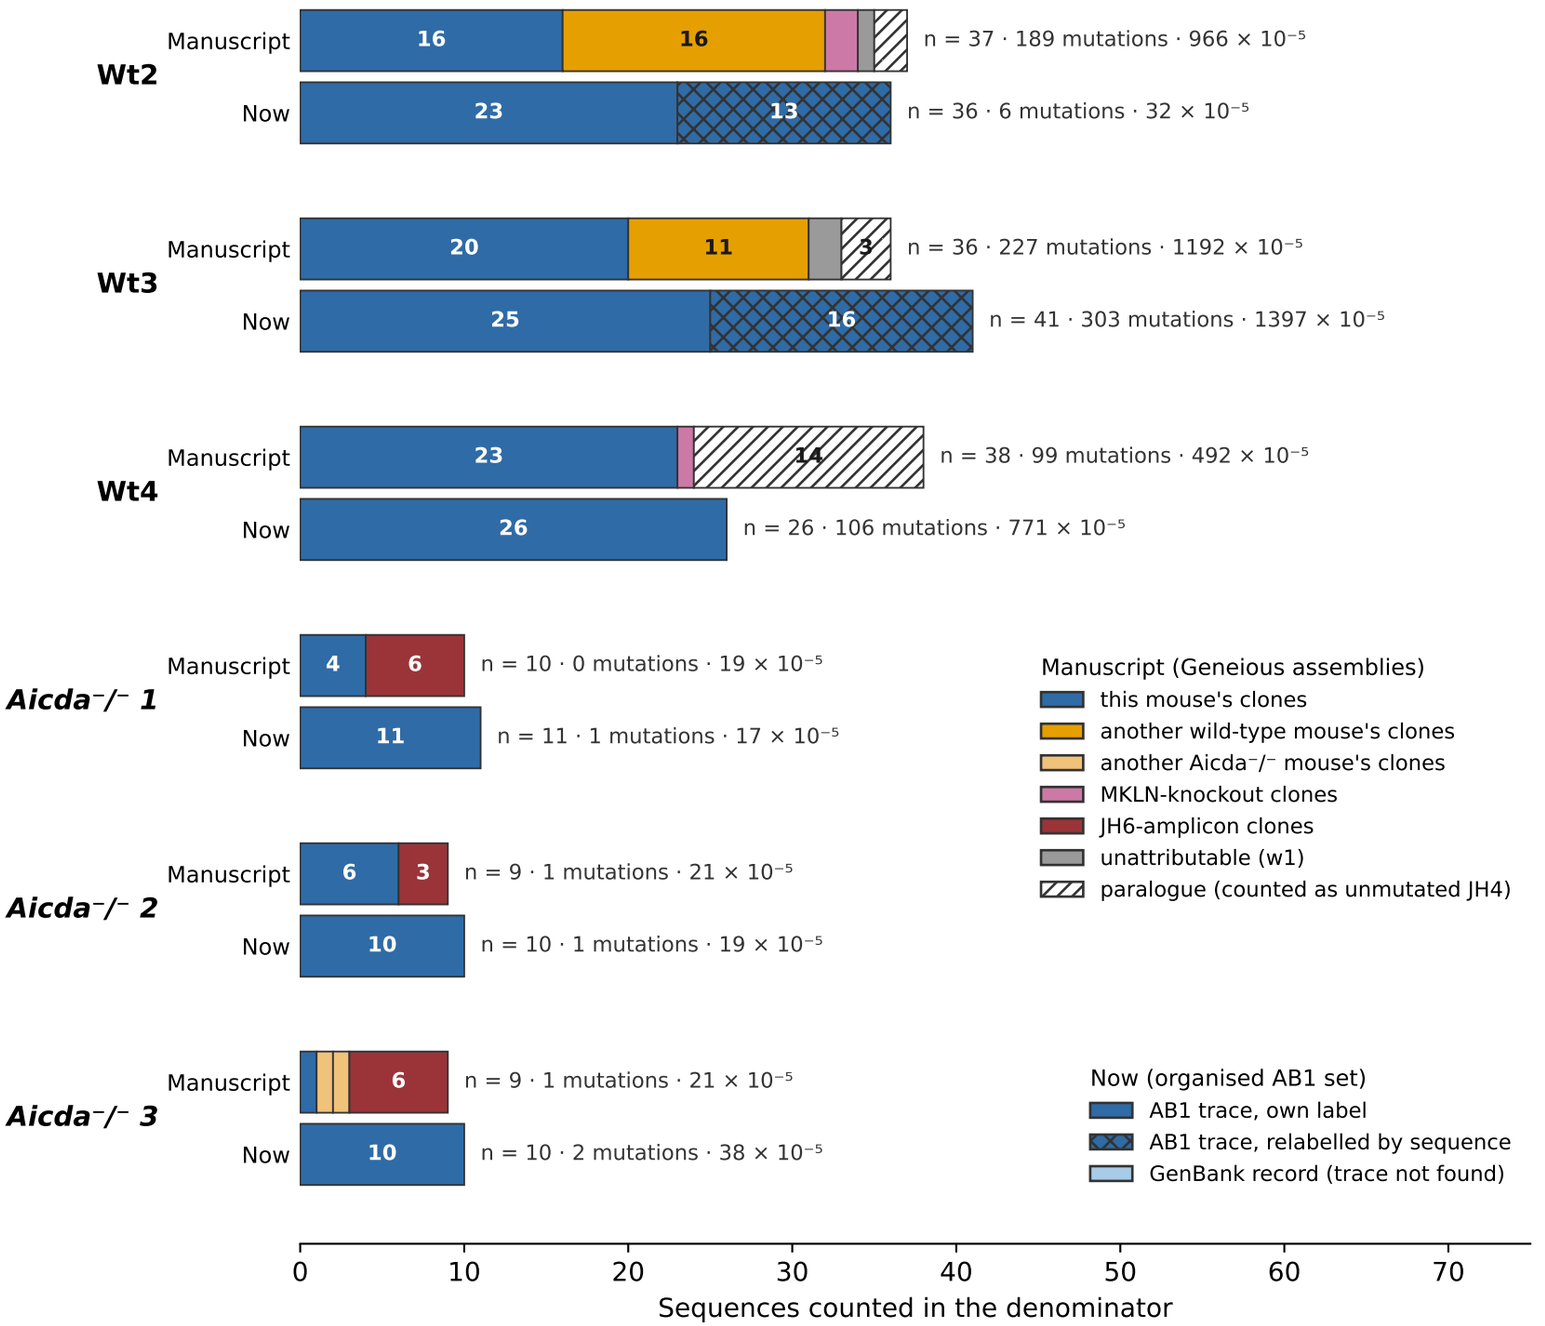
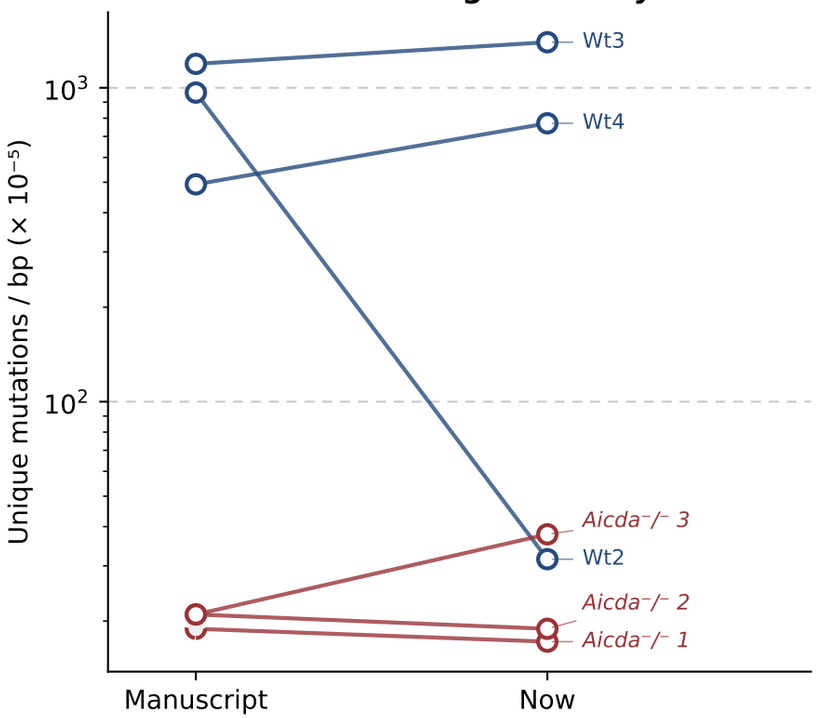
A What each mouse's Sanger value was built from



B Each mouse's Sanger density



grey dashed: no mutation, shown at one mutation's worth

C The group comparison

	Wt	Aicda⁻/⁻	Fold	P
Sanger, manuscript	828	20	41×	0.0045
Sanger, now	324	23	14×	**0.1490**
Nanopore (unchanged)	57	0.55	103×	0.0017

Geometric means, × 10⁻⁵; Welch's t on log10, three mice per group.
Correctly assigned, Wt2's own clones sit at the knockout level,
so Sanger alone no longer separates the groups; nanopore does.
