
A
The whole amplicon from each read (positions 90–1,230)
shared Sanger window (529 bp)
additional interval read only by nanopore
Wt mean
individual Wt mice
Aicda−/− mean
Unique variants per 10^5 bases
JH4 amplicon position (bp); 50-bp bins
B
AID targeting against error
targeting index (mean mutability at called positions ÷ window mean): Wt mice 1.22–1.36; null 1.00
Per position, relative to mean
Wt calls
Aicda−/− mismatches
least
most
S5F mutability quintile (~106 positions each)
C
Clones from the V(D)J junction
24 clones; junction read in 79%
33 clones; junction read in 72%
16 clones; junction read in 55%
Wt2
Wt3
Wt4
Reads (% of 500)
largest clone
other clones
junction unreadable
Frequency
per 10^3 bp
read-weighted
clone-weighted
D
Read-level reconstruction of one Wt3 clone (69 reads)
48 of 69 reads (70%) fit one path; the other 21 carry mutations of more than one branch and are counted at each node they carry
Mutations since the clone's unmutated ancestor
mutation: G:C transition
mutation: G:C transversion
mutation: A:T
inferred unmutated ancestor
node: number = reads carrying every mutation up to it (size scales with it)
branch: reads diverge
