
A
Sμ amplicon, 651 bp
(the bundled reference)
Sμ repeats: where AID acts
300-bp single-end read
(6 of 9 wild-type libraries)
R1 of a pair
(all 9 AID-null, 3 wild-type)
R2 of the same pair
mates do not overlap: only 9–21% of pairs merge
window B: the stretch every library reads
window C: the repeats, paired libraries only
B
Window B: shared, but outside the repeats
wild type
Aicda−/−
Unique mutations per library

80
100
the only window every library reads lies outside the repeats, so this deposit cannot answer the drug question here; AID-null stays at background throughout
DMSO
Idelalisib
Duvelisib
C
Window C: the Sμ repeats
Unique mutations per library

calls carry the AID signature:
targeting index 1.52–1.67, C→T/G→A 31–35%
wild type
(n = 3)
Aicda−/−
(n = 9)
every library here is paired, so no layout difference; but one wild-type library per treatment against three AID-null, pooled as a descriptive contrast
